

# MINIMONEY.GUIDE

## Complete Platform & AI Automation Guide

Every platform reviewed — explained simply — with a step-by-step AI guide for each.

*Source: minimoney.guide | Compiled April 2026*

## How to read this guide

---

Each platform has a card showing its AI potential, realistic earnings, and a specific list of how to use AI tools (Claude, ChatGPT, etc.) to maximise results. The colour-coded badges tell you at a glance how useful AI is:

|                      |                                                                                            |
|----------------------|--------------------------------------------------------------------------------------------|
| <b>AI: GREAT FIT</b> | AI can directly multiply your output or income. Make this your primary focus.              |
| <b>AI: MODERATE</b>  | AI helps with planning, research, or specific sub-tasks but cannot automate the core work. |
| <b>AI: LIMITED</b>   | AI plays a minor supporting role — setup, tracking, or comparison. Core work is manual.    |
| <b>AVOID</b>         | Do not use this platform. No AI strategy overcomes the fundamental problem.                |

Tiers refer to your geographic location's advertising value: Tier 1 (US, UK, AU, CA) earns the most on GPT/offer platforms. Research and AI gig platforms pay equally regardless of location.

## SECTION 1 — RESEARCH STUDIES

### Research studies

The best dollar-per-minute category online. Academic researchers and AI labs pay real humans to answer genuine questions. Pay is pre-agreed, there are no screen-outs, and wages are enforced. If you qualify, start here before anything else.

#### Prolific

**AI: MODERATE**

*Researchers and AI labs pay you to complete studies. Pre-screened — no mid-survey dropouts. Best dollar-per-minute online.*

Earnings: \$50–200/month | Effort: Medium | Best for: All tiers (OECD preferred)

#### How to use AI with Prolific

- Use AI to fill out your demographic and interest profile exhaustively — every extra data point unlocks more studies.
- Set up a simple AI-generated notification routine: check Prolific 2–3x daily at fixed times and act within minutes of a new study appearing.
- Use Claude or ChatGPT to help you write clear, thoughtful open-text answers quickly without sacrificing quality.
- Ask AI to summarise academic topics you are unfamiliar with before a study starts — better comprehension = better responses.
- Do NOT automate study completion. Responses must be genuine. Prolific uses attention checks and will ban you.

#### CloudResearch Connect

**AI: MODERATE**

*Same model as Prolific — flat per-study pay regardless of location. Smaller volume but equal quality. Run both in parallel.*

Earnings: \$20–100/month | Effort: Medium | Best for: Select OECD countries

#### How to use AI with CloudResearch Connect

- Complete your profile with AI assistance — comprehensive profiles unlock the most studies on this platform.
- Use AI to draft thorough open-ended answers for writing-heavy tasks.

- If a study involves evaluating AI outputs, use Claude to help you form structured, reasoned ratings.
- No automation of study completion is permitted.

## SECTION 2 — GPT SITES (SURVEYS & OFFERS)

### GPT sites — surveys and offers

Get Paid To sites aggregate surveys, app installs, game offers, and cashback tasks. They earn by keeping 10–50% of what advertisers pay. The same offer can pay wildly different amounts across sites — always compare before starting.

#### ySense

AI: LIMITED

*Aggregates multiple survey routers in one dashboard. Best global reach of any GPT site — strong for Tier 2 and 3 countries.*

Earnings: \$20–80/month | Effort: Medium | Best for: Global

#### How to use AI with ySense

- Use AI to quickly type through open-text survey fields without losing quality.
- Log your offer completions in a spreadsheet and ask AI to identify which routers are crediting reliably each month.
- Use AI to draft polite but firm support tickets when offers fail to credit — include screenshots and exact timestamps.
- Actual offer and survey completion must be manual — automation violates ToS and gets accounts banned.

#### CashInStyle

AI: LIMITED

*UK-focused GPT site with a low \$2 cashout threshold. The Cherries survey wall pays you even on screen-outs — a rare and valuable feature.*

Earnings: \$30–100/month (Tier 1) | Effort: Medium | Best for: Tier 1 best

#### How to use AI with CashInStyle

- Before starting any offer, use AI to compare the payout on CashInStyle vs Freecash and Swagbucks — spend your time on the best rate.
- Focus on Cherries wall tasks where you get paid even if disqualified — AI cannot solve the disqualification problem on other walls.
- Use AI to write complaint messages to support when offers do not credit, citing specific terms and providing a clear evidence summary.

## Swagbucks

AI: LIMITED

*One of the oldest GPT platforms. Surveys, videos, shopping cashback, and game offers in one place. Keeps 30–50% of offer value.*

Earnings: \$20–60/month | Effort: Medium | Best for: Tier 1 best

### How to use AI with Swagbucks

- Use AI to compare identical offer payouts between Swagbucks and higher-paying alternatives before committing hours to a task.
- Ask AI to plan your daily Swagbucks routine to hit streak bonuses — consistent daily check-ins compound over a month.
- AI can research the fastest strategies for specific game-install offers before you start.
- Direct automation violates ToS — manual completion only.

## Freecash

AI: LIMITED

*Popular GPT site with a cleaner UI. Game-grind offers pay slightly better than Swagbucks. Keeps around 30% of offer value.*

Earnings: \$30–150/month | Effort: Medium–High | Best for: Tier 1

### How to use AI with Freecash

- Before committing to a multi-hour game offer, use AI to research the fastest route to the required milestone (Reddit threads, walkthroughs).
- Use AI to cross-check the same offer across Freecash, CashInStyle, and Swagbucks — identical offers can pay 2–3x more on one site.
- AI can help you organise a completion log tracking which offers are pending, credited, or disputed.
- No bots. Game offer tracking uses device fingerprinting and will ban you for automation.

## SECTION 3 — AI TRAINING GIGS

### AI training gigs

The highest-earning category for active work. AI companies need human-labeled data, prompt writers, and voice recordings. These are real part-time jobs paying \$17.50–40/hr. AI tools can multiply your output here more than anywhere else on this list.

#### Babel Audio

**AI: GREAT FIT**

*Record conversations and voice samples for AI training datasets. Pays \$17.50/hr. Rare languages earn more. Requires a decent microphone and a clear speaking voice.*

Earnings: \$17.50–25/hour | Effort: Part-time (flexible) | Best for: Global — language-dependent

#### How to use AI with Babel Audio

- Use AI to generate diverse conversation scripts and prompts before each recording session — massively speeds up preparation.
- Ask Claude to suggest a wide variety of sentence structures, tones, topics, and emotional registers to hit variety quotas faster.
- Use AI to check scripts for natural-sounding, grammatically clean dialogue before you record.
- Non-native speakers can use AI-generated phonetic guides and practice scripts to improve pronunciation before sessions.
- Build a personal prompt library with AI — organise by topic, tone, and length so you can pull ready-made scripts for any session.
- AI cannot do the recording itself. Voice quality, naturalness, and mic clarity are evaluated by humans.

#### DataAnnotation

**AI: GREAT FIT**

*Write and review AI prompts, rate AI responses, and label data. \$20–40/hr. No mic needed. Flexible hours. Apply and treat it like a part-time job.*

Earnings: \$20–40/hour | Effort: Part-time (flexible) | Best for: Select countries

#### How to use AI with DataAnnotation

- Use Claude to draft high-quality, diverse prompts quickly — then review, edit, and submit as your own considered work.

- AI can help you spot logical flaws, factual errors, or reasoning gaps in AI responses you are being asked to rate.
- For domain-specific tasks (code review, math problems, science questions), use AI to explain the topic so you can rate answers accurately.
- AI writing tools reduce the time from idea to polished prompt — the bottleneck becomes quality review, not drafting.
- Use AI to study DataAnnotation's rubrics and guidelines so you understand what a high-scoring submission looks like.
- Build a swipe file of prompt structures with AI assistance — varied, complex prompts score higher and take less time once you have a library.

## Outlier

AI: GREAT FIT

*Prompt writing, AI conversation rating, and RLHF tasks. Similar to DataAnnotation. Apply to both and take whichever accepts you first.*

Earnings: \$15–35/hour | Effort: Part-time (flexible) | Best for: Select countries

### How to use AI with Outlier

- Draft complex, nuanced prompts using AI — Outlier rewards depth and variety, both of which AI can help generate quickly.
- Use AI to research any topic you are asked to evaluate: coding problems, factual claims, historical events, or reasoning chains.
- AI can help write detailed written justifications for your ratings — a key scoring factor on Outlier tasks.
- Ask Claude to critique prompts you have written before submitting — look for ambiguity, leading language, or poor instruction structure.
- Combine AI drafting with your own subject expertise for the highest-quality submissions. Pure AI output without human review is detectable.

## SECTION 4 — PASSIVE BANDWIDTH APPS

### Passive bandwidth apps

Install once, earn passively. These apps share a small slice of your internet connection with market research and SEO companies. Stack all three on a single always-on device. The ceiling is low but the effort is near zero.

#### Pawns.app

AI: LIMITED

*Shares a tiny slice of your internet connection with market researchers. Install on any always-on device and forget about it.*

Earnings: \$3–10/month per device | Effort: Near zero | Best for: Global (US/UK IPs earn more)

#### How to use AI with Pawns.app

- AI is not needed for daily operation — install and forget.
- Use AI to calculate the electricity cost vs income for each device you are considering running it on.
- Ask AI to set up a simple tracking spreadsheet to log monthly payouts across all three bandwidth apps.
- Use AI to automate a monthly check-in reminder to verify the app is still running on all devices.

#### EarnApp

AI: LIMITED

*Routes market research traffic through your IP while you are not using your connection. Stack with Pawns.app and Honeygain for maximum passive income.*

Earnings: \$3–10/month per device | Effort: Near zero | Best for: Global (residential IPs)

#### How to use AI with EarnApp

- AI is not needed to operate. Just stack all three bandwidth apps on one always-on device.
- Use AI to draft a setup checklist covering installation of all three apps across different operating systems.
- Use AI to research whether your ISP terms allow bandwidth sharing before installing.

#### Honeygain

AI: LIMITED

*Third bandwidth-sharing app to stack alongside EarnApp and Pawns.app. Combined monthly passive earnings from the trio: \$15–30 for one always-on device.*

Earnings: \$3–12/month per device | Effort: Near zero | Best for: Global (residential IPs)

### How to use AI with Honeygain

- Stack all three bandwidth apps — combined passive earning requires zero ongoing effort.
- Use AI to compare current payout rates across all three apps and prioritise the one offering the best rate if bandwidth is limited.
- Ask AI to write a short script that checks if all three apps are running and alerts you if one goes offline.

## SECTION 5 — CASHBACK APPS

### Cashback apps

These are rebate tools, not earning tools — they save money on purchases you were going to make anyway. The AI angle is strong here because purchase planning is exactly what AI is good at.

#### Rakuten

**AI: GREAT FIT**

*Browser extension that automatically applies cashback at hundreds of online retailers. 1–15% back on purchases you were making anyway. Pays quarterly.*

Earnings: 1–15% on eligible spend | Effort: Near zero after setup | Best for: US, Canada, UK, Australia

#### How to use AI with Rakuten

- Use AI to research which categories and retailers currently have the highest Rakuten cashback rates before making any purchase.
- Ask Claude to build a weekly pre-purchase checklist: before buying anything online, check Rakuten portal first.
- Use AI to plan seasonal purchase timing around Rakuten triple-cashback events (Black Friday, holiday sales).
- Stack Rakuten with credit card rewards — ask AI to identify which of your cards maximises points on top of cashback.
- AI can help you calculate cumulative annual savings and project what that money does if invested.

#### Ibotta

**AI: MODERATE**

*Scan grocery and retail receipts for cashback on specific products. Also has a browser extension for online shopping. Strongest for grocery and household purchases.*

Earnings: 1–10% on groceries | Effort: Low | Best for: US

#### How to use AI with Ibotta

- Before writing your weekly grocery list, ask AI to cross-reference it against Ibotta's current offers and suggest substitutions where a similar product pays cashback.
- Ask Claude to compare Ibotta vs Fetch for your typical weekly haul — the best app varies by store and category.

- Use AI to build a meal plan that maximises Ibotta rebates without changing what you eat.
- AI can set up reminders so you never forget to clip an offer before shopping.

## Fetch

AI: MODERATE

*Scan any receipt for points redeemable as gift cards. Looser rules than Ibotta — almost any receipt earns something.*

Earnings: Varies (gift cards) | Effort: Low | Best for: US

### How to use AI with Fetch

- Use AI to identify which gift card redemptions give the best real-world value for your points balance.
- Ask AI to build a receipt-scanning habit (e.g. scan before discarding any receipt — Fetch accepts restaurant, gas, and most retail receipts).
- AI can help you decide when to save points vs redeem for maximum value.
- Stack with Ibotta — ask AI which app to use for each specific store.

## Upside

AI: MODERATE

*Location-based cashback on gas, groceries, and restaurants. Check the app before fuelling up or dining out.*

Earnings: 1–25c/gallon gas; 1–15% dining | Effort: Low | Best for: US

### How to use AI with Upside

- Integrate Upside into your regular route planning — ask AI to plan drives that pass Upside-listed gas stations.
- Use AI to build a pre-fill ritual: check Upside before every gas fill, grocery shop, or restaurant visit.
- Stack with a cashback credit card — ask AI which combination gives the highest return at your most-visited gas station.
- Ask AI to track your monthly Upside savings vs total fuel spend to quantify the habit's value.

## Dosh

AI: LIMITED

*Link your card once and earn automatic cashback at participating hotels, restaurants, and retailers. No scanning needed — fully hands-off.*

Earnings: 1–10% at partners | Effort: Near zero | Best for: US

### How to use AI with Dosh

- Fully automatic after card linking — no AI needed for daily operation.
- Use AI to identify which of your regular spending categories overlaps most with Dosh partners.
- Ask AI to compare Dosh partner restaurants vs Upside restaurants in your area to decide which app to prioritise per visit.

## SECTION 6 — CRYPTO MINING

# Crypto mining

Only viable if your electricity is free or very cheap. In most setups, the power bill exceeds the crypto earned. Run the numbers with AI before committing any hardware time.

## Kryptex

**AI: MODERATE**

*Windows PC mining app. Uses your GPU to mine crypto and pays in USD or BTC. Only profitable if your electricity is very cheap or free.*

Earnings: Depends entirely on electricity cost | Effort: Low setup; high power draw | Best for: Global

### How to use AI with Kryptex

- Before running Kryptex, use AI to calculate your personal break-even electricity rate: input your GPU model and local \$/kWh rate.
- Ask AI to research current mining profitability for your specific GPU (use sites like WhatToMine and have AI interpret the numbers).
- Use AI to write a simple Windows Task Scheduler script to mine only during off-peak electricity hours or when your PC is idle.
- Ask AI to monitor BTC and crypto price trends monthly and alert you if profitability crosses your break-even threshold.

## Salad

**AI: MODERATE**

*GPU mining app that pays in credits redeemable for gift cards and game items. Lower barrier than Kryptex but the same electricity cost problem exists.*

Earnings: Depends on GPU and electricity | Effort: Low setup | Best for: Global

### How to use AI with Salad

- Use AI to calculate whether Salad credits convert to better hourly value than the electricity cost.
- Ask AI to write a scheduling script to run Salad only overnight or during off-peak hours when electricity is cheapest.
- AI can help you compare the value of Salad's gift card redemptions to find the best conversion rate for your credits.

## GoMining

AI: LIMITED

*Cloud mining service — rent hashing power instead of using your own hardware. Removes the electricity problem but adds a subscription cost. Returns are usually marginal.*

Earnings: Usually marginal to negative | Effort: Near zero (passive) | Best for: Global

### How to use AI with GoMining

- Before subscribing, use AI to run the ROI calculation: contract cost vs current BTC price vs projected daily yield vs break-even timeframe.
- Ask AI to monitor BTC price trends and flag if your contract moves into profitable territory.
- AI cannot improve the underlying economics of cloud mining — use it to decide whether to enter, not to optimise after the fact.

## Rollercoin

AI: LIMITED

*Browser-based mining simulator. Play mini-games to earn virtual mining power, which then earns small amounts of real crypto. Gamified and very low yield.*

Earnings: Very low | Effort: Medium (games) | Best for: Global

### How to use AI with Rollercoin

- Use AI to calculate whether time spent on Rollercoin mini-games converts to a better hourly rate than other platforms on your list.
- Treat earnings as a bonus for game time you would spend anyway — AI cannot meaningfully optimise this further.

## SECTION 7 — INVESTING

# Investing — where side hustle income goes

Not a side hustle itself, but where every dollar you earn should eventually go. The minimoney.guide experiment invests all earnings into Robinhood. AI is a strong research and planning tool here.

## Robinhood

AI: GREAT FIT

*The platform minimoney.guide invests all side hustle earnings into. Commission-free stock and ETF trading. This is where your earnings grow — not a side hustle itself.*

Earnings: Market returns (variable) | Effort: Time + discipline | Best for: US (expanding)

## How to use AI with Robinhood

- Use Claude to research ETFs, index funds, and individual stocks before investing any side hustle earnings.
- Ask AI to explain any financial term, earnings report, or market event in plain language before making a decision.
- Use AI to build a simple dollar-cost averaging plan: define a fixed weekly or monthly contribution from your side hustle earnings and automate it.
- Ask AI to compare S&P 500 index funds vs total market funds vs dividend ETFs and explain the trade-offs for your specific goal.
- AI can help you build a tracking spreadsheet that shows total invested, current value, and return — updated monthly.
- Use AI to set personal investing rules (e.g. never invest money you need in the next 12 months) and have it quiz you before each deposit.

## SECTION 8 — PLATFORMS TO AVOID

### Platforms to avoid

These are gambling products marketed as side hustles. No AI strategy, system, or technique overcomes a house edge. Skip entirely.

#### Bingo Cash / Triumph

**AVOID**

*Mobile apps marketed as 'earn real money playing games.' You must deposit real cash to unlock money rounds. House always wins. These are gambling products.*

#### Why you should avoid this platform

This is a gambling product, not a side hustle. The house edge guarantees losses over time. Heavy TikTok advertising targeting people looking to earn money is the biggest red flag in the industry. No AI strategy can overcome a built-in mathematical disadvantage. Do not use.

#### Stake / Casino-style apps

**AVOID**

*Crypto casino dressed up as an earning platform. Requires deposits. House edge guarantees long-term losses. The advertising budget reveals who is actually paying whom.*

#### Why you should avoid this platform

Any platform requiring a deposit to 'earn' is a gambling product. The math always favours the house. The fact that these apps are advertised constantly as easy money is the loudest warning sign possible. Do not use.

# Your AI toolkit — how to use Claude and ChatGPT across all platforms

---

These are the core AI techniques that apply across multiple platforms. Master these and you will extract value from AI regardless of which platform you are working on.

## 1. Prompt drafting and open-text answers

For any platform requiring written responses (Prolific, DataAnnotation, Outlier, Babel Audio scripts):

- Give AI context: paste the question or task description and ask for a clear, honest answer in plain language.
- Always review and edit before submitting — AI-generated responses that are not reviewed are detectable and can get accounts flagged.
- Use AI to suggest multiple versions of the same answer so you can pick the most natural-sounding one.

## 2. Rate and offer comparison

For any GPT site (Freecash, CashInStyle, Swagbucks, ySense):

- Before starting any offer over 30 minutes, paste the task description and payout into Claude and ask: 'Is this a good hourly rate? Where else might this offer pay more?'
- Build a comparison table over time and ask AI to analyse which offerwall has the best crediting rate based on your own data.

## 3. Spreadsheet and earnings tracking

Applies to all platforms:

- Describe your earnings setup to Claude and ask it to build you a Google Sheets or Excel formula-based tracker.
- At the end of each month, paste your earnings data and ask AI for a summary: best platform, worst platform, hourly rate per category, and recommendations.

## 4. Support ticket writing

When an offer does not credit:

- Describe the situation to Claude (platform, offer name, date, amount, evidence you have) and ask it to write a firm but professional support request.
- AI-written support tickets are clearer and more persuasive than frustrated manual ones — and often get faster responses.

## 5. Profitability calculations

For crypto mining and passive income decisions:

- Give AI your electricity rate (\$/kWh), GPU model, and hours per day to get a real break-even analysis before committing.

- For bandwidth apps, ask AI to calculate net monthly income after estimated electricity cost per device.

## 6. Shopping and cashback optimisation

For Rakuten, Ibotta, Fetch, Upside, and Dosh:

- Before any purchase over \$20, ask AI: 'Which cashback app gives the best return at [store]? Is there a portal bonus this week?'
- Ask AI to build you a pre-purchase checklist habit you will actually stick to.

## 7. Investment research

For Robinhood and long-term investing of side hustle income:

- Use AI as your first-pass financial research assistant — but always verify with official sources (SEC filings, prospectuses) before committing money.
- Ask AI to explain compound interest, dollar-cost averaging, expense ratios, and other fundamentals until you genuinely understand them.
- AI is not a licensed financial adviser. Use it for education and research, not for buy/sell decisions.

## Recommended monthly stack (Tier 1)

Based on minimoney.guide's own testing, here is the realistic monthly income if you run the full stack 1–2 hours per day:

| Platform(s)                               | Monthly (realistic)   | AI multiplier?                                             |
|-------------------------------------------|-----------------------|------------------------------------------------------------|
| Pawns.app + EarnApp + Honeygain           | \$15–30               | No — install and forget                                    |
| Prolific + CloudResearch                  | \$50–200              | Moderate — profile + open text                             |
| CashInStyle / Freecash                    | \$50–100              | Moderate — offer comparison                                |
| Babel Audio or DataAnnotation (10 hrs/wk) | \$700–1,000           | HIGH — script prep, prompt drafting                        |
| Cashback apps (Rakuten + Ibotta + Fetch)  | \$20–100 saved        | High — purchase planning                                   |
| Investing (Robinhood)                     | Market returns        | High — research + planning                                 |
| <b>FULL STACK TOTAL</b>                   | <b>\$800–1,300/mo</b> | AI drives the AI gigs category — the single biggest earner |

Note: earnings are calibrated for Tier 1 (US, UK, AU, CA). Tier 2 users should focus on Prolific, CloudResearch, and AI gig platforms which pay equally regardless of geography.
